

## Are you losing money to Corn Rootworm?

If your traited corn yield is suffering from rising Corn Rootworm damage, we can help. A single application of our biocontrol nematodes can protect your corn from rootworm damage for decades! Our biocontrol nematodes kill rootworm larvae before they can damage your corn. Customers with severe rootworm pressure typically see a 20% to 40% increase in corn yield during the first year. Since our nematodes persist in your field across growing seasons, they'll provide the same protection for decades after that. This truly is a long-term investment in your farm.

Our technology was discovered at Cornell University and is backed by 25 years of research. Persistent nematodes have been applied to 30,000+ acres across the US and are the only solution to combat Corn Rootworm resistance to Bt traited corn.

## Key Product Features

- Protects yield, increases profitability
- Fights developing CRW resistance
- Persistent, multi-year impact
- Center pivot / spray rig application
- Easy application
- Mitigates existing CRW resistance
- Apply once, anytime (soil temp > 50F)
- Compatible with all CRW management

## Pricing

**\$60 / acre**      \$6 / acre discount when you pay when ordering  
\$4 / acre discount on orders over 200 acres

*Minimum lead time from order to delivery is 4 weeks, multiple discounts stack, offer expires Dec 2022, all offers are subject to change without prior notice.*
